# Versatile temperature sensors – for all kinds of applications

## Temperature sensors

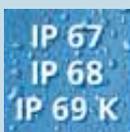

**Temperature sensors in contact with the medium for industrial and hygienic applications**

**Modular concept – tailor-made for all kinds of applications**

**Various fittings available for process connections**

**Robust mechanics with high vibration and shock resistance**

**Non-contact infrared temperature sensors for hot objects**

### Direct temperature sensors

The temperature sensors of ifm are based on a PT100 or PT1000 resistor. The measured temperature value corresponds to a change in resistance and is converted into an electrical analogue signal. A microprocessor controls the evaluation of the electrical signal. Depending on the product version, the current system temperature is indicated via LED display and provided as a switching signal, analogue signal or via IO-Link.

### Indirect temperature measurement

In most cases the infrared temperature measurement is used where temperatures can only be measured indirectly, that means without contact. The reason for this can, for example, a high object temperature. The sensors detect the infrared radiation emitted by the objects and convert them into an output signal.
